

Create a workspace by using the Azure portal

Let's create a new workspace and experiment. You can quickly set up a workspace by using the Azure portal or via Python code. We'll go through each approach here.

Create a workspace by using the Azure portal

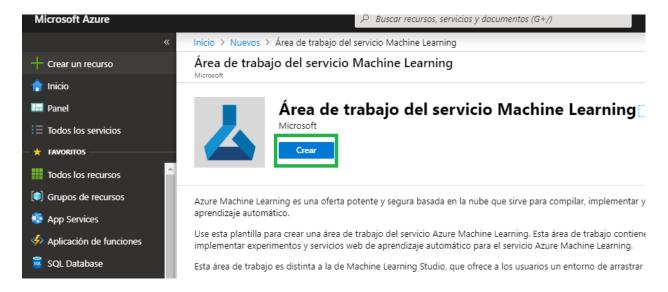

Follow these steps to create a workspace in the Azure portal.

- 1. Sign in to the <u>Azure portal</u> using your Azure subscription.
- 2. In the Search box at the top of the portal, type **machine learning service** workspaces.

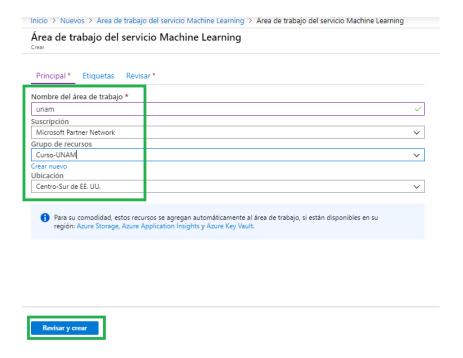

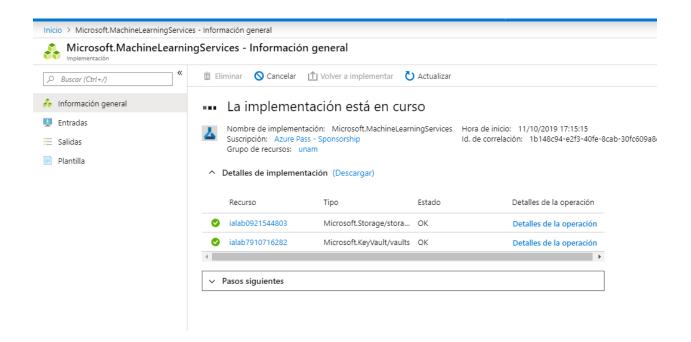

Field	Description
Workspace name	Enter a unique name for your workspace. In this example, you use AMLSLearnworkspace . The names must be unique across the resource group. Use a name that is easy to remember and different from workspaces that others create.
Subscription	Select the Azure subscription that you want to use.
Resource group	Use an existing resource group in your subscription or enter a name to create a new resource group. A <i>resource group</i> is a container that holds related resources for an Azure solution. In this example, you use rgAMLSLearnworkspace .
Location	Select the location closest to your users and the data resources. This location is where the workspace is created.

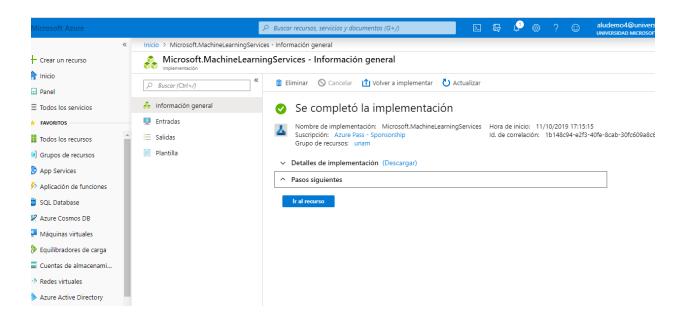

3. Select the "Machine Learning Service Workspaces" option under SERVICES.

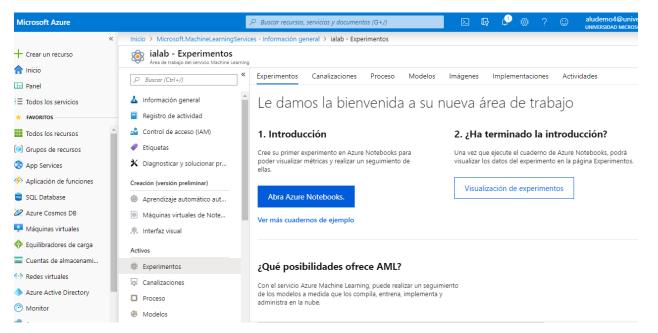

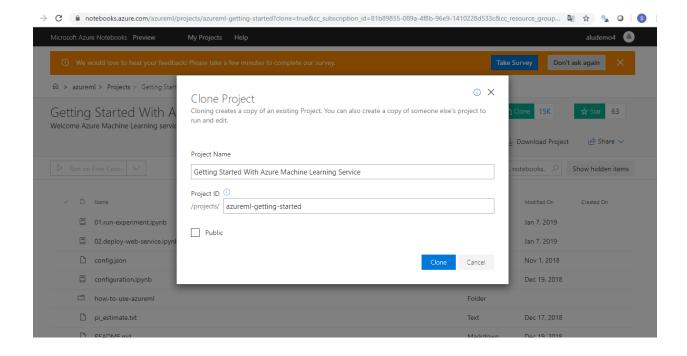

4. Select **Add** at the top left of the Machine Learning service workspaces pane, and then enter the necessary information to create the workspace.

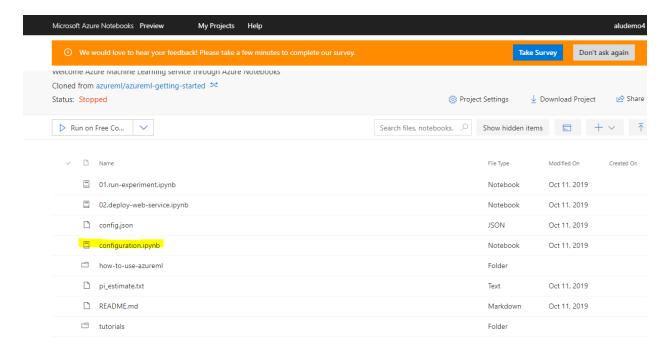

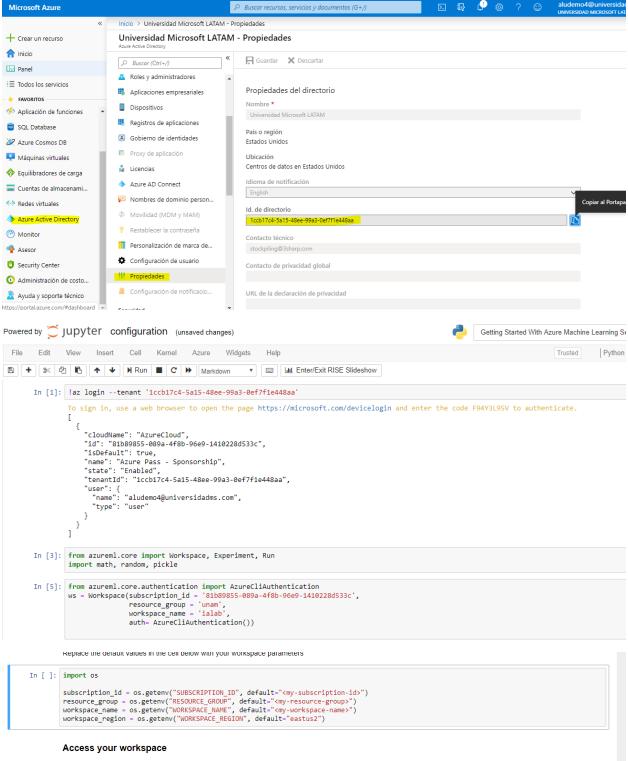

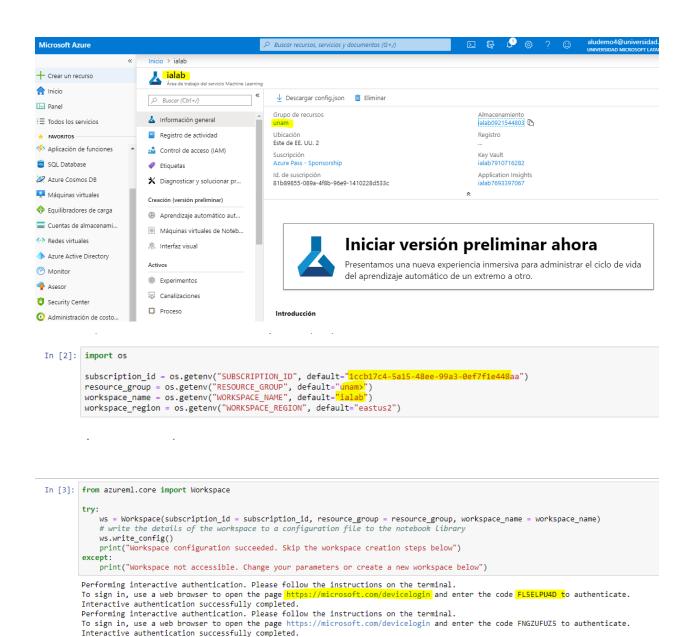

Agregar el siguiente código al inicio del archivo de configuración laz login --tenant "id de suscripción"

The following cell uses the Azure ML SDK to attempt to load the workspace specified by your parameters. If this cell succeeds, your notebook library will be configured to access the workspace from all notebooks using the Workspace.from_config() method. The cell can fail if the specified workspace doesn't exist or you don't have permissions to access it.

Workspace not accessible. Change your parameters or create a new workspace below
